

3.8 Quiz: Linear and quadratic functions

1. A linear function f is graphed below.

(a) Write down it's slope.

$$m = 3$$

(b) Write down it's y -intercept.

$$b = 2$$

(c) Write down the equation of the line.

$$y = 3x + 2$$

(d) State the coordinates of the point Q .

$$(1, 5)$$

2. Write the linear equation $y - 2 = \frac{1}{4}(x + 8)$ in the form $y = mx + c$.

$$y = \frac{1}{4}x + 4$$

3. Given $f(x) = (x - 4)(x + 2)$

(a) Sketch the function. Label the vertex as an ordered pair and mark the intercepts with their values.

(b) Expand the function to standard form,
 $f(x) = ax^2 + bx + c$ where $a, b, c \in \mathbb{R}$.

$$f(x) = x^2 - 2x - 8$$

4. The function $f(x) = -x^2 + 4x$ is shown on the graph.

- (a) Write down its vertex as an ordered pair.

$$(2, 4)$$

- (b) Write down its domain and range.

$$D: x \in \mathbb{R}$$

$$R: y \leq 4$$

- (c) Write down $f(0)$.

$$0$$

- (d) Write down two solutions to $f(x) = 0$.

$$x = 0, 4$$

5. Consider the function $f(x) = x^2 + 2x - 3$. (graph it to answer the questions)

- (a) This function can also be written in the form $f(x) = (x - p)^2 - 4$. Write down the value of p .

$$p = -1$$

- (b) The graph of f has two solutions for $f(x) = 0$. Write down the solutions (or roots, zeros) of the function.

$$x = -3, 1$$

- (c) Hence, write down the function in factored form, $f(x) = (x - a)(x - b)$.

$$f(x) = (x - (-3))(x - 1)$$

6. Given two functions, a quadratic function $f(x) = 0.6x^2 + 2.1x - 3$ and a linear function $g(x) = 1.2x + 2$.

- (a) Graph the parabola $y = f(x)$, marking the y -intercept and the vertex as an ordered pair.
- (b) Find the coordinates of the two intercepts with the x -axis, the roots or zeros of $f(x)$.

$$(-4.5894541\dots, 0) \approx (-4.59, 0)$$

$$(1.089454\dots, 0) \approx (1.09, 0)$$

- (c) Plot the linear function, $y = g(x)$. Mark and label the two intersections of the two functions $f(x) = g(x)$ as ordered pairs. Round to the nearest hundredth.

$$(-3.732588\dots, -2.47910\dots), (2.232588\dots, 4.67910\dots)$$

7. A dart is shot vertically upwards.

The path of the dart can be modelled by the equation $h(t) = 6t - t^2$ where $h(t)$ is the height in meters of the dart after t seconds.

- (a) Plot a graph of this equation and hence sketch it below, showing the coordinates of the vertex and axes intercepts.

- (b) Find the t -intercepts and explain what these values represent.

$t = 0, 6$ are the times when the dart is on the ground. The dart is in the air during those six seconds.

- (c) Find the equation of the axis of symmetry, and state what this tells you in the context of the problem.

$t = 3$. After three seconds the dart stops going up and starts falling. The maximum height is reached at that time.
